The Buccal Fat Pad an Option in the Zygomatic Implant Surgery

Edsardo José de MORAES* & Nathalia Ferreira de MORAES**

INTRODUCTION

The use of buccal fat pad (BFP) flap in craniofacial fields is the treatment of maxillofacial trauma injuries as well as the choice of reconstructive flap for facial defects in the maxillofacial region. The use of the BFP allows for immediate flap harvest to the flap, which is recommended for the treatment of maxillofacial trauma. The zygomatic implants were initially proposed by Schwartz with the objective of the stabilization of maxillary maxilla. The buccal fat pad and zygomatic implants in the maxillary anterior region and 2 zygomatic implants in the maxillary region have been the preferred alternative for the treatment of maxillofacial trauma. In such cases, buccal fat pad is usually harvested using a different approach with buccal placement of incision, superior or inferior to the zygomatic implant. However, in the maxillary anterior only buccal approach, or in critical cases with 4 zygomatic implants, there are 20% risk of facial deformity due to the buccal fat pad harvest. The objective of this presentation is to present a technique to prevent facial deformity in zygomatic implants surgery.

19	M	45	1	1	1	1	1	1	1
20	M	45	1	1	1	1	1	1	1

CONCLUSIONS

The BFP flap is a reconstructive technique with superior blood supply and facial contour, which is a reconstructive technique with superior blood supply and facial contour, which is a reconstructive technique with superior blood supply and facial contour.
